

External PCI DSS Security Scans

Check Your IT Security according to the Recognized Credit Card Industry Standard

The leading credit card organizations established a worldwide valid security standard with its Payment Card Industry Data Security Standard (PCI DSS). Companies that store, process or transfer credit card data must have their IT systems regularly checked for vulnerabilities with a PCI DSS Security Scan. However, the results are only recognized if the scan has been performed by an internationally certified provider (Approved Scanning Vendor or ASV). usd AG has been authorized as an ASV to perform such scans worldwide since 2005.

What distinguishes our external PCI DSS Security Scan?

- You check your Internet-accessible IT systems (servers, networks, Web servers, Web Shops etc.) for several thousand known and continuously updated vulnerabilities using a standardized, internationally recognized process.
- PCI DSS Security Scans are performed for each IP address; recognized vulnerabilities are not exploited. The risk of a disruption of the normal operations of your IT systems is minimal.
- You will receive a scan result in the form of a summary and a comprehensive technical report. This report contains all the vulnerabilities that were identified as well as detailed suggestions on how to eliminate them. Following the initial scans, you can rescan your systems free of charge to see whether you have successfully eliminated the vulnerabilities.
- If no critical vulnerabilities according to PCI DSS are identified, then your IT infrastructure is PCI DSS compliant, and you will receive a certificate and a seal of approval as a confirmation to be used with banks, customers, insurance companies and certified public accountants.
- usd PCI Competence Center experts will support you in answering questions and resolving any problems.
- Due to the extraordinarily dynamic threat potential, you should have PCI DSS Security Scans performed on a regular basis. We recommend, in accordance with the PCI standard, that you have scans performed every 3 months or after relevant system changes.

Prices

A PCI DSS Security Scan costs € 220.00* for one IP address, plus € 12.00* for each additional IP address.

4 PCI DSS Security Scans – our Annual Package – costs € 780.00* for one IP address, plus € 39.00* for each additional IP address.

*The statutory value-added tax must be added to the above specified prices.

Please take note of special terms (discounts, coupons etc.) available during promotions with our cooperation partners.
